

Salary prediction Using Regression

Name – Lovely Pandey

CSE/3rd Year

**LLOYD INSTITUTE OF ENGINEERING
& TECHNOLOGY**

➤ Introduction:

- ❑ **Salary Prediction is a machine learning project where we predict a person's salary based on their years of experience.**
- ❑ **In this project, we used AutoAI in IBM Watson Studio to automatically build the best machine learning model.**

➤ Objective:

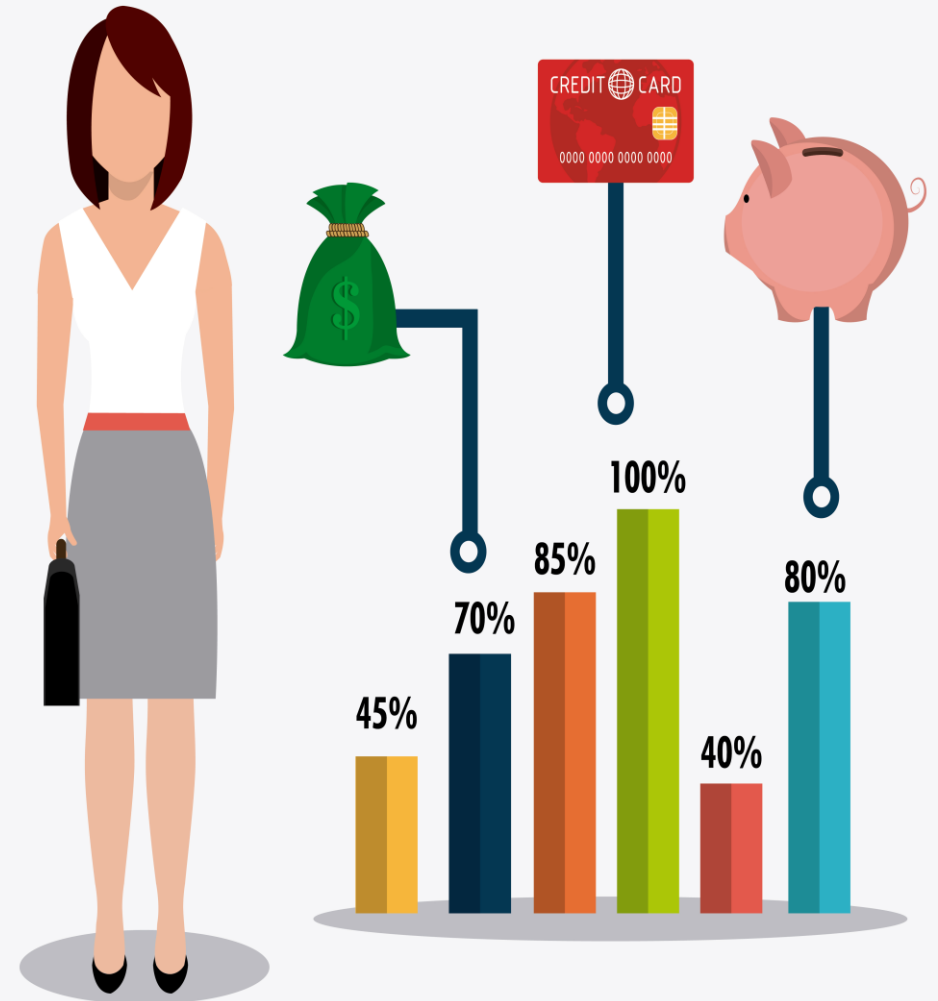

The main objective of this project is:

- ☐ To predict salary based on experience.
- ☐ To analyze the relationship between experience and salary.

➤ Tools used:

- ☐ IBM Cloud
- ☐ IBM Watson Studio
- ☐ AutoAI
- ☐ Dataset (Experince vs Salary)

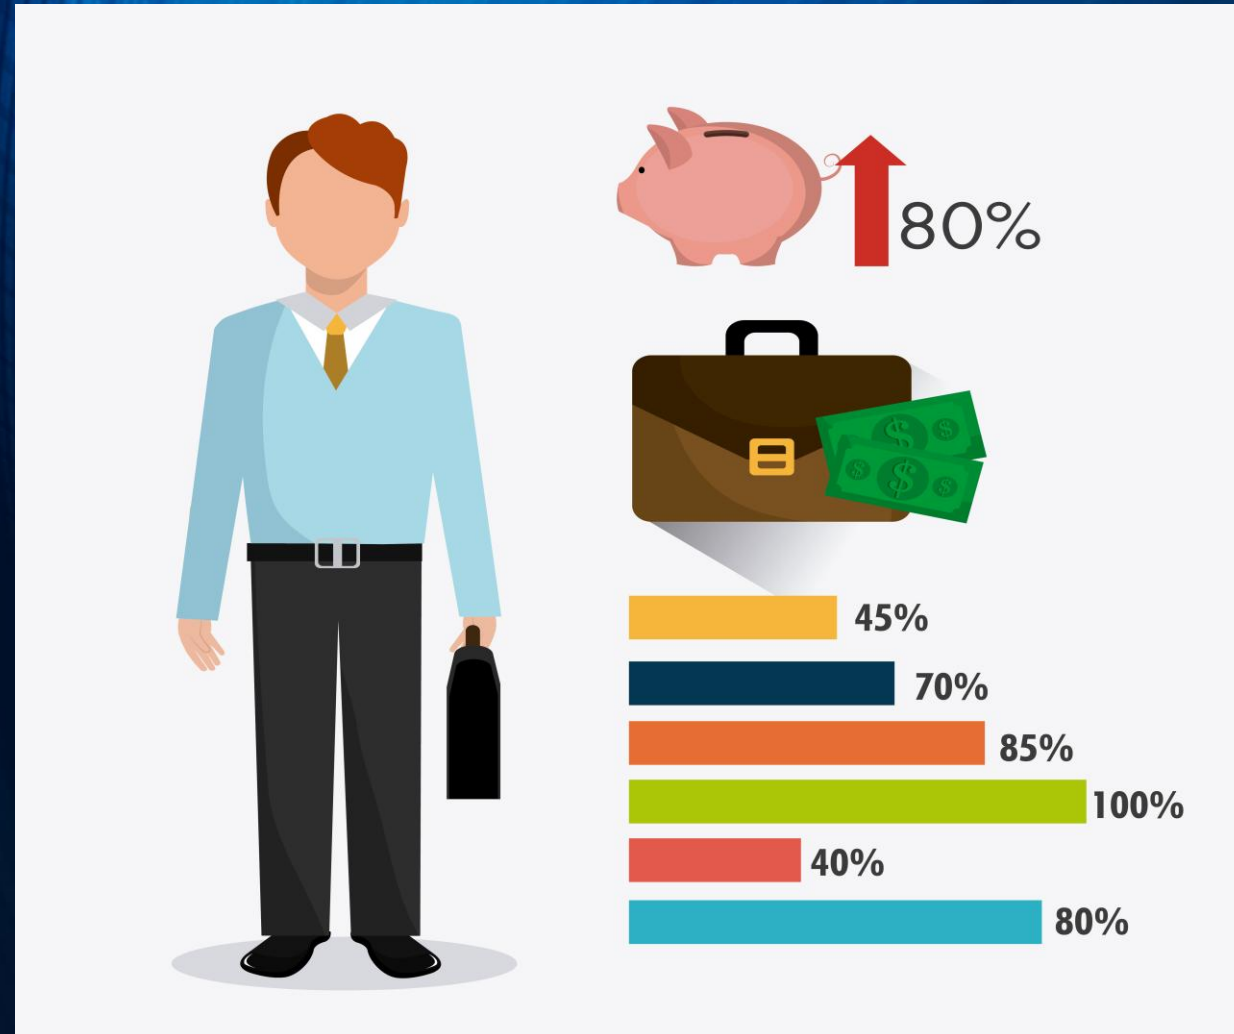

➤ What is AutoAI?

- ❑ **AutoAI is a tool in IBM Watson Studio that:**
- ❑ **Automatically selects the best algorithm**
- ❑ **Cleans and prepares the data**
- ❑ **Trains multiple models**
- ❑ **Selects the best performing model**
- ❑ **It reduces manual coding and saves time.**

➤ Working Process:

- 1) Upload dataset (Salary data)
- 2) Select target column (Salary)
- 3) Run AutoAI experiment
- 4) AutoAI builds multiple models
- 5) Best model is selected automatically
- 6) Model is used to predict salary

➤ Result:

The model shows a positive relationship between:

Years of Experience ↑

Salary ↑

The graph shows actual salary data and predicted salary line.

➤ Conclusion:

- ❑ **AutoAI makes machine learning easy and fast.**
- ❑ **It helps in building accurate models without complex coding.**
- ❑ **Salary prediction can help companies in decision making.**
